Executive summary

Pitch mix, swing-and-miss performance, and tactical tendencies

PROFILE AT A GLANCE

3,308
pitches in dataset

42.3%
curveball whiff rate

32.3%
four-seam whiff rate

KEY FINDINGS

1. The four-seam fastball leads the arsenal by volume, at roughly 44% of pitches.
2. The curveball generates the highest whiff rate (42.3%), on 142 swings.
3. The four-seam fastball also misses bats (32.3% on 811 swings).
4. Cutter use increases when behind in the count; fastball use rises ahead.
5. Four-seam locations cluster high, while curveballs trend lower.

SCOUTING INTERPRETATION

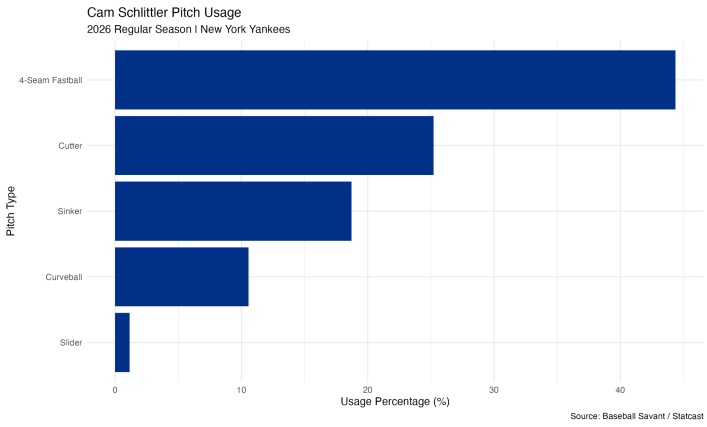

Schlittler combines a fastball-heavy approach with multiple movement profiles. The curveball is his top swing-and-miss offering by rate in this sample, while the four-seamer produces the most total whiffs. His cutter and sinker add different shapes and give him alternatives across count situations.

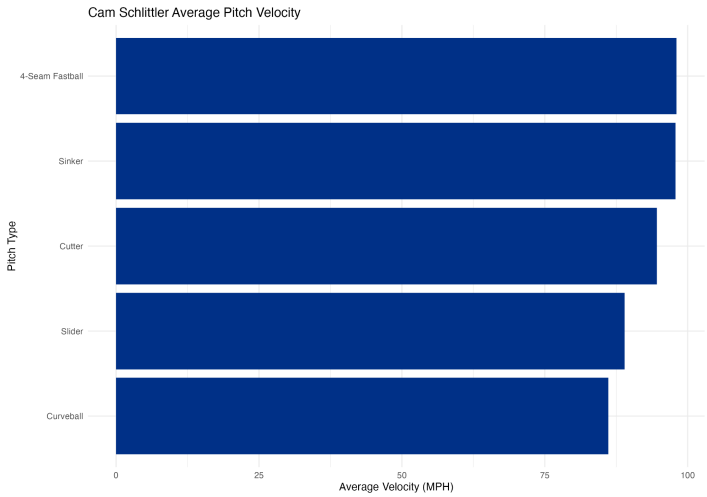

ANALYTICAL CAUTIONS

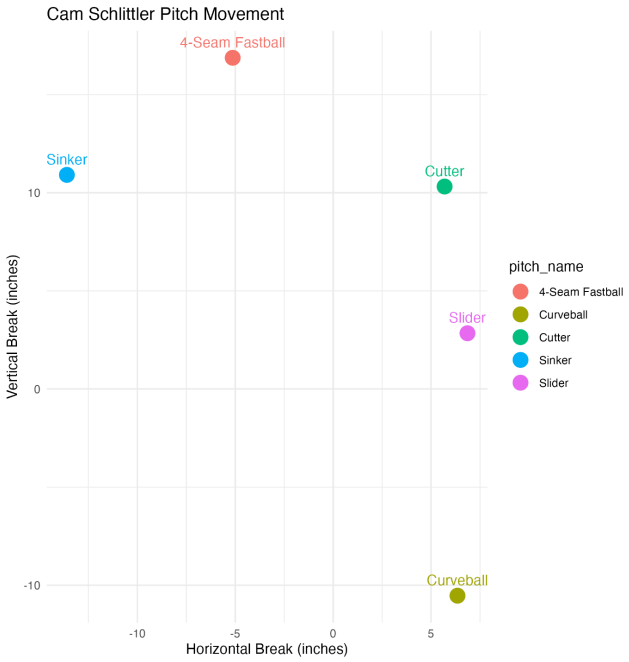

Whiff rate here means swinging misses divided by swings, not by pitches. The slider has only 12 recorded swings, so its 25% rate is unstable. These charts describe observed results, not pitch quality independent of location, opponent, count, or other context.

Pitch arsenal and movement

Usage, velocity, and the shape of each offering

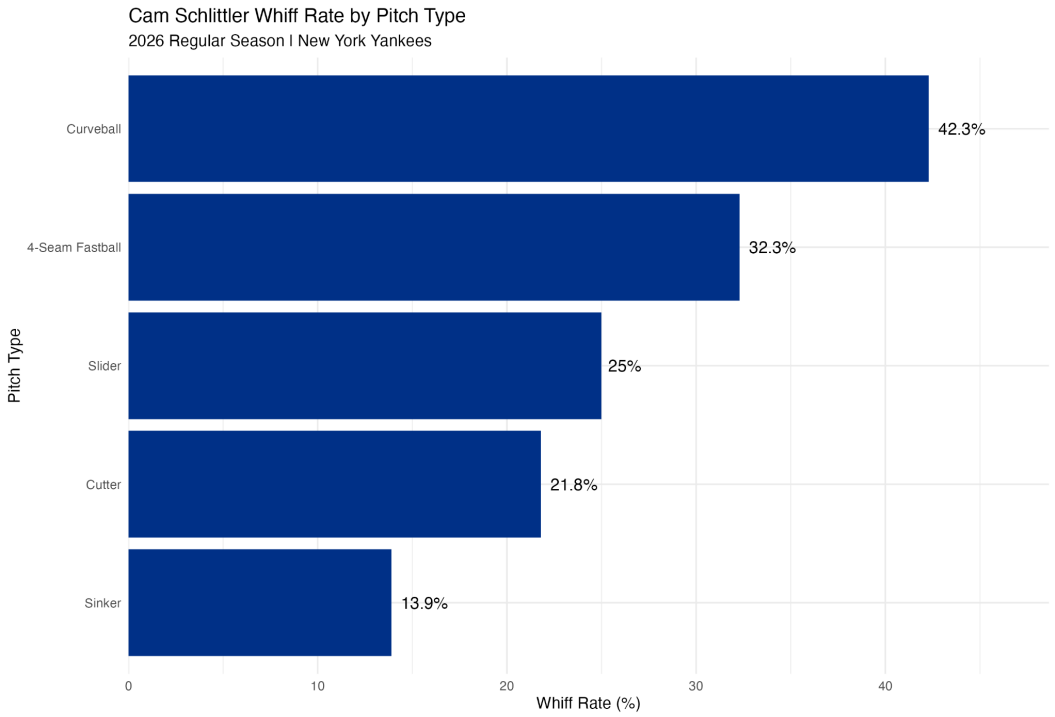

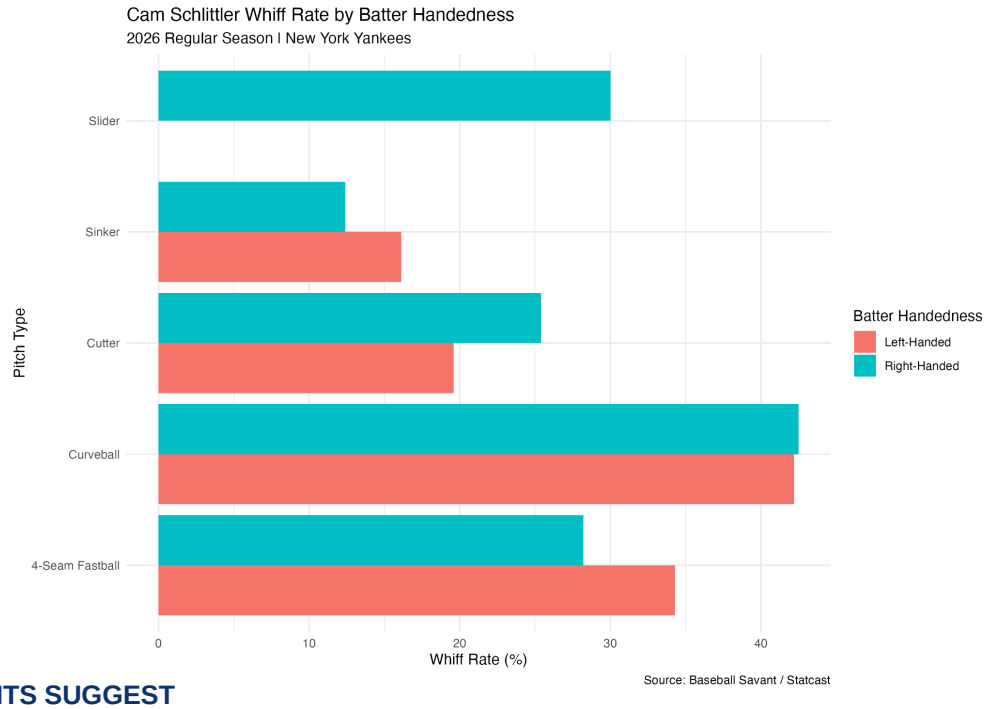

ARSENAL TAKEAWAY

The four-seamer is the primary pitch, followed by the cutter and sinker. Movement profiles show separation between the four-seam, sinker, cutter, and downward-breaking curveball. The slider is used sparingly.

Swing-and-miss profile

Overall whiff rates and splits by batter handedness

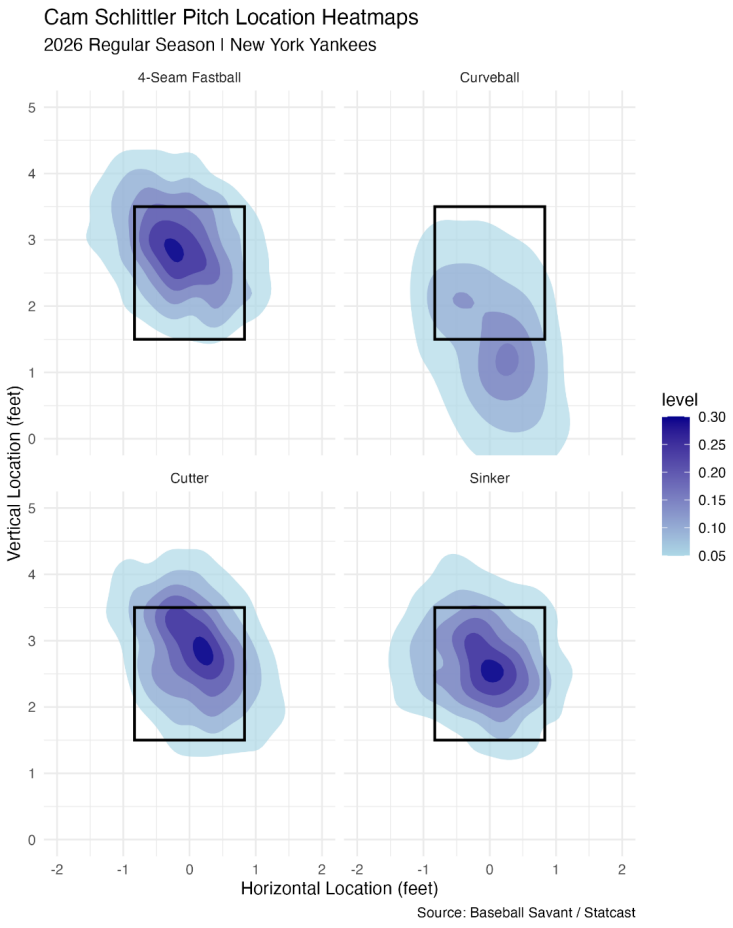

WHAT THE SPLITS SUGGEST

The curveball performs similarly against both sides (~42%). Four-seam whiff rate is higher vs. left-handed batters (34.3%) than right-handed batters (28.2%). These are descriptive splits, not adjusted comparisons.

Pitch location tendencies

Density estimates of observed pitch locations

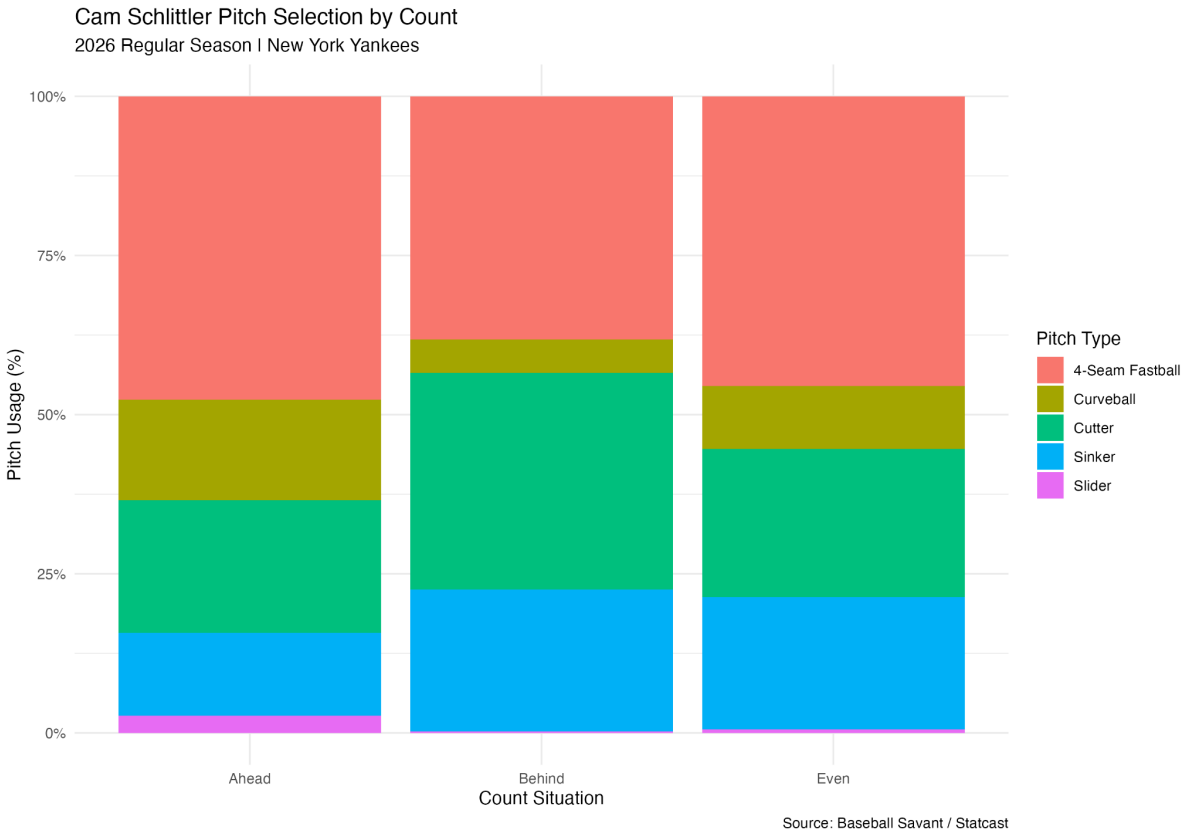

LOCATION NOTES

Four-seam fastballs are concentrated in the upper zone; cutters and sinkers cluster nearer the middle of the zone. Curveballs trend lower. Density contours show relative concentration, not a probability of a called strike.

Count strategy and conclusions

How the mix shifts with leverage and what to investigate next

COUNT-BASED TENDENCIES

Ahead: the four-seamer accounts for nearly half the pitches.

Behind: cutter usage increases and fastball usage decreases.

Even: a more balanced mix of four-seam, cutter, and sinker.

NEXT QUESTIONS FOR THE ANALYST

Check pitch outcomes by count and batter handedness together.

Compare whiff rates with chase rate, zone rate, and called-strike-plus-whiff rate.

Quantify uncertainty for low-sample pitches and split-level results.

Validate release and movement definitions before cross-pitch comparisons.

BOTTOM LINE

A fastball-led arsenal with a high-whiff curveball and flexible secondary usage.
